Proxmox Deployment Evidence

Doctor Clinic DevOps System

Document 06 | Live Deployment Proof

Muhammed Munir Al Tawil | May 26, 2026

1. Deployment Summary

The Doctor Clinic DevOps System was successfully deployed on a Proxmox Virtual Environment (PVE 8.4.14) on May 26, 2026. The application is live and publicly accessible on the internet.

Property	Value
Proxmox Host	april26-bootcamp-dataops (PVE 8.4.14)
Host Public IP	51.158.200.127
VM ID / Name	100 / Doctors-Clinic-DevOps-System
VM Internal IP	10.10.10.100 (vmbr1 bridge)
OS	Ubuntu 22.04.5 LTS (KVM)
VM Resources	2 vCPU / 4 GB RAM / 22 GB Disk
Public URL	**http://51.158.200.127:8080**
Deployment Date	May 26, 2026

2. Container Status Evidence

The following output was captured from the live VM showing all three Docker containers running successfully:

```
root@Doctors-Clinic-DevOps-System:/opt/doctor-clinic# docker compose ps
NAME            IMAGE               STATUS          PORTS
doktors_app     doctor-clinic-app   Up 22 minutes   9000/tcp
doktors_mysql   mysql:5.7           Up 22 minutes   0.0.0.0:3307->3306/tcp
doktors_nginx   nginx:alpine        Up 22 minutes   0.0.0.0:8080->80/tcp
```

Container	Status	Role
doktors_app (PHP-FPM 8.2)	**DONE**	Laravel application server

Container	Status	Role
doktors_mysql (MySQL 5.7)	**DONE**	Relational database with persistent volume
doktors_nginx (Nginx Alpine)	**DONE**	Reverse proxy, port 8080 → 80

3. Database Migration Evidence

All 16 database migrations executed successfully against the MySQL container:

```
INFO  Running migrations.
0001_01_01_000000_create_users_table ..................... DONE
0001_01_01_000001_create_cache_table ..................... DONE
0001_01_01_000002_create_jobs_table ..................... DONE
2026_03_23_110009_create_doctor_profiles_table .......... DONE
2026_03_23_110009_create_specialties_table .............. DONE
2026_03_23_110010_create_doctor_availabilities_table .... DONE
2026_03_23_110011_create_appointments_table ............. DONE
2026_03_23_110012_create_appointment_slots_table ........ DONE
2026_03_23_110012_create_clinic_settings_table .......... DONE
2026_03_23_110013_create_card_payments_table ............ DONE
2026_03_23_110200_add_role_fields_to_users_table ........ DONE
2026_03_23_110201_create_doctor_specialty_table ......... DONE
2026_03_25_160328_create_page_contents_table ............ DONE
2026_03_25_160348_add_image_to_specialties_table ........ DONE
2026_03_27_150000_create_notifications_table ............ DONE
2026_03_27_170000_add_work_schedule_to_doctor_profiles .. DONE
```

4. Database Seeding Evidence

All seeders ran successfully, populating the database with demo clinical data:

Seeder	Status	Duration
BaselineSeeder	**DONE**	1,961 ms
SpecialtyCatalogSeeder	**DONE**	19 ms
PageContentDemoSeeder	**DONE**	11 ms
DemoMedicalStaffSeeder	**DONE**	4,206 ms
DemoDoctorSpecialtySeeder	**DONE**	60 ms
DemoDoctorAvailabilitySeeder	**DONE**	3,014 ms
DemoAppointmentAndPaymentSeeder	**DONE**	513 ms
BulkQuickDoctorAppointmentsSeeder	**DONE**	8,347 ms
MunirClinicQuickDemoAvailabilitySeeder	**DONE**	822 ms

5. Network Architecture

The deployment uses a two-tier network architecture on Proxmox:

- vmbr0 — Public bridge: Proxmox host IP 51.158.200.127/24, connected to internet
- vmbr1 — Internal bridge: 10.10.10.1/24, NAT masquerade to vmbr0
- VM 100 on 10.10.10.100 — internal, accessed via iptables DNAT port forwarding
- iptables PREROUTING rule: 51.158.200.127:8080 → 10.10.10.100:8080
- NAT masquerade: iptables -t nat POSTROUTING on vmbr0 for 10.10.10.0/24
- Rules persisted via iptables-persistent / netfilter-persistent

```
Internet → 51.158.200.127:8080 → [DNAT] → 10.10.10.100:8080
                                          → Nginx container :80
                                          → PHP-FPM app container :9000
                                          → MySQL container :3306
```

6. Deployment Steps Summary

The following steps were executed to deploy the application on the Proxmox VM:

#	Step	Result
1	Clone Ubuntu 22.04 template	VM 100 created from template 9000
2	Configure Cloud-Init	user: ubuntu, network: 10.10.10.100/24
3	Resize disk to 22 GB	growpart + resize2fs on /dev/sda1
4	Install Docker CE	docker-ce + docker-compose-plugin installed
5	Clone GitLab repository	gitlab.com/MunirAltawil/Doctor-Clinic-DevOps-System
6	Configure .env	DB_HOST=mysql, credentials configured
7	docker compose up -d --build	3 containers built and started
8	php artisan migrate + db:seed	16 migrations + 9 seeders completed
9	npm install + npm run build	Vite assets compiled to public/build
10	Configure iptables NAT + port forward	Application accessible on public internet

7. Live Application Verification

The application was verified live in browser at http://51.158.200.127:8080 showing the Doctor Clinic homepage with:

- Navigation: Doctors, Specialties, About, Contact, Login, Register
- Hero section: "Book care with clarity — slots you can trust"
- Features: Hourly slots with conflict-safe scheduling
- Features: Role-aware dashboards for every stakeholder
- Features: Transparent rates and visit history
- Laravel 12.43.1 / PHP 8.2.31 running in production
